Abstract (en)

The engine has an injection device provided for direct injection of fuel into a combustion chamber, and an operation variable determination unit for determining operation variables of the engine. An emission determination device (1) determines a position of centre of gravity for the fuel combustion. The device (1) determines an unburned carbon emission value as emission value based on injection pressure and the position. An independent claim is also included for a method for determination of emission value for the exhaust gas formed during fuel combustion in a combustion chamber of an internal combustion engine.
