Abstract (en)

[origin: WO2005078178A1] Current knitting production characterized by the combination of a ribbed welt or double bed beside an area of plain knitting or single bed strongly jeopardizes the manufacturing process since it requires a strong take-down, which extends or deforms the stitch and the fabric during the knitting process, also producing an additional, unwanted stress onto the yarn under working. The invention relates to a method and related equipment for producing knitwear items provided with ribbed welt beside plain knitted fabric produced under optimal conditions with knitting sinkers. According to the invention, the quality of plain knitted fabric greatly improves, the single garment or piece of cloth is discharged in an easier way, with various manufacturing, economic, aesthetic and commercial advantages.
