Abstract (en)  
[origin: EP1715100A1] Vertical locking is provided by a resting surface for the holding section (11) and/or a support surface for the head section (13) of the connector. The head section is supported over regions of its periphery, preferably its underside, on the support surface. The support surface and head surface resting upon it, are complementary in form. The connector projects from the main body (3) sidewalls (17, 19, 21, 23), which also include the corresponding connector receivers (9). The connecting components (3, 9) are integral with the sidewalls of the main body. Both the attachment (11) and head (13) of the connector project outwardly, the attachment and the main body being integral. The head includes a beveled surface for run-in. The receiver (9) includes a lead-in angle. The main body is a grid structure. It is round or polygonal, triangular, square or rectangular. The head (13) is rectangular or round, when seen in plan view. The penetration (15) is U-shaped, to match the attachment (11). The panel is preferably manufactured from recycled plastic granules by injection molding.
