Abstract (en)

[origin: EP1715281A1] The device has two ammunition cases (7a, 7b) arranged side by side and integrated to a lateral wall (8) of a gun carriage (3). An insertion channel (10) is rotatably mounted with respect to an axis perpendicular to the wall, where the axis coincides with an axis (2) of a trunnion of a weapon. The case has a lower opening arranged above the cases and at the level of a vertical plane separating the two cases, where each case slides with respect to the wall to pass from an initial position to a final position after removal of the other case.
