Abstract (en)
[origin: WO2005080698A1] The invention concerns a plumbing spout device (4), which has a jet regulating device (5), which is situated on the outflow side and upstream from which an attachment screen (6) is connected in the direction of flow. The jet regulating device (5) is provided in the form of a perforated plate having at least one perforated field in at least one partial area. The inventive spout device (4) is characterized in that: a mounting sleeve (7) is provided that supports, on its outflow-side sleeve end area, the jet regulating device (5), and; the mounting sleeve (7) is joined to the water spout (3) of the plumbing spout fitting (1) via a screwed, clip, detent, adhesive or weld connection. The spout device (4) is also characterized by having a comparatively low installation height that does not significantly limit the design possibilities when designing the associated spout fitting. The spout device (4) also makes it possible to achieve a high jet quality and a good jet pattern.
