Abstract (en)

The device has a cover (1) for opening and closing a U-shaped transversal section and articulated at an end of a bracelet. An internal section of the cover allows sliding a fitting (2) articulated at another end of the bracelet. The fitting presents notches (2d1) cooperating with pins (6) and is mounted with a lateral displacement capacity to be retracted temporally for releasing the pins to adjust the length of the bracelet. Springs (7) are adjusted to create a transversal bearing pressure for engaging the pins with the notches.
