Abstract (en)

[origin: US2006239753A1] A device for packaging and applying a cosmetic product includes a container for holding the product. The container can have an opening; an applicator including: a rod; an applicator element at a first end of the rod, a grasping portion connected to a second end of the rod. The applicator can be configured to be attached by snapping onto the container so as to accommodate the applicator element in the container. A wiper element can be fixed in the container in proximity to the opening. The wiper element can be open at its lower end to allow the applicator element to pass through at least partially when the applicator is mounted on the container. The rod can be in leaktight bearing contact substantially perpendicular to the lengthwise axis of the rod on an inner surface of the wiper element thereby closing the container in a leaktight manner when the applicator is mounted on the container.
