Abstract (en)

[origin: EP1717027A2] A gear train (ARZ) connects all plate cylinders (PZ1-PZ4). At least two of the plate cylinders (PZ2,PZ3) are equipped with independent drive motors (M1,M2). With the motors operated, the plate cylinders are synchronized to rotate in one mode, in which the cylinders are at different phase positions, or in another mode, in which the cylinders are at same phase positions. An independent claim is also included for a method for driving rotating bodies in a printing machine.
