Abstract (en)

[origin: EP1717836A1] A fuse holder has supporting lugs (20, 21), which are formed curved at the side walls (2) at the end (13) of the fuse holder. The supporting lugs exhibit a radius which corresponds to the external radius of coding elements (15). The side walls are provided with ribs (30, 31), opposite to each other, near the end of the fuse holder. The ribs protrude inwards from the side panels. The side walls are arranged, to a large extent, parallel to each other and are kept at a distance which is equal to the outer diameter of the coding element. The coding element is assigned as a separate part and can be removed and has a bush section (36), which specifies an opening, which specifies a predetermined size of the pole of the fuse element.
