Abstract (en)
[origin: WO2005077814A1] The invention relates to a double-jointed bit for horses, said bit comprising two outer lateral parts (20) that are preferably embodied as rings, and a bit part that is arranged between said outer parts and connected thereto. Said bit part has two lateral sections (22) and an olive-shaped central section (24), the central section (24) being connected to each of the two lateral sections (22) by means of an articulated element. Said articulated elements are formed by two articulated boreholes (26) embodied in the central section (24) and respectively a loop (30) provided in each lateral section (22). The central section (24) comprises a base part (34) and an additional part (36), the two articulated boreholes (26) being embodied in the base part (34). The additional part (36) is located essentially between the two articulated boreholes (26) and forms the outer surface of the central section (24) in the region of the central cross-section between the two articulated boreholes (26).
