Abstract (en)

[origin: DE102004009233A1] Device for controlling driving and switching processes of a vehicle comprises a control unit (13) with a first calculating module (28), by which an engine theoretical revolutions value is calculated for the switching processes depending on the gear output revolutions, and a second calculating module (29) by which the fuel injection amount for the engine is calculated depending on the driving pedal deviating angle and the engine revolutions and/or the gear input revolutions. Preferred Features: The control unit is connected to a sensor (13) for acquiring the operational position of the clutch (4).
