Abstract (en)
[origin: WO2005078968A1] In a method for transmitting service information between network nodes in a wireless system providing one or more multimedia broadcast/multicast service (MBMS), when one terminal is moved from a first network node to a cell managed by a second network node, the first network node receives status information of the cell from the second network node, and when the specific terminal is moved into the cell, the first network node selectively transmits an MBMS connection request message to the second network node. In this case, the status information includes MBMS service area information if a neighboring cell with respect to the MBMS service for which the specific terminal has joined and/or information an MBMS function is supported.
