Abstract (en)

The device for control of adjustable single motor divided frame (1) of a reclining chair comprises a control system (5) for the single motor and a program source (7) for release of control programs for development of control data for controlling the single motor for programmed-operational adjustment of the frame. The program source is linked to an input unit (9) that has a source (8) for an additional programme to calculate the control data from the program source's released programs that are dependent on the input parameters from the input unit and the control system.
