Abstract (en)

[origin: WO2005082619A1] The invention relates to a method and a device for the alternate operation of a first and a second printing unit (05, 05.1, 05.2) through which a web (02) runs, said printing units having one guiding element (01) each in at least one feed and/or discharge area for deflecting the web (02), which can be optionally introduced into the web path. In a first operation situation, the first printing unit (05.1, 05.2) is in the print-on position and the guiding element (01), disposed in the feed and/or discharge area, of the first printing unit is switched off, while the second printing unit (05.2, 05.1) is in the print-off position and the guiding element (01) disposed in the feed and/or discharge area of said second printing unit (05.2, 05.1) is placed against it. In a second operating situation, the second printing unit is in the print-on position and the guiding element (01), disposed in the feed and/or discharge area, of said second printing unit is switched off, while the first printing unit is in the print-off position and the guiding element (01) disposed in the feed and/or discharge area of said first printing unit is placed against it.
