Abstract (en)
[origin: EP1721742A2] The calendar has a retainer (4) comprising two retaining parts (7, 8) on both sides of processing rollers, which include embossing sleeves (6a, 6b) that are detachably connected with bearing rollers (5a, 5b). Rotatable bearing parts (9a, 9b) are arranged on the parts (7, 8). The parts (7, 8) are flexibly interconnected over a sliding guide, such that the parts (7, 8) are movable relative to one another in a direction of a rotation axis between processing and service positions, and are swivelable relative to one another around a swivel axis that is running transverse to the rotation axis.
