Abstract (en)

The locking system has identifying bearer activation and a locking element attached to both door sides to operate the lock mechanism using bearer activation to change it from unlocked to engaged position. The coupling unit (12) which couples it to the identification bearer activation via an actuator has two halves, one (13,15) attached to a handle (9) on one side of the door, the other (14,16) attached to a handle (37) on the other. Through identifying bearer activation using an actuator (33) on the door, both halves can move from released to engaged mode.
