Abstract (en)

[origin: EP1722052A1] The device has a mortise lock with a flat metallic control rod having segments fixed free in longitudinal translation on multiple panels constituting a gate integrated to a sectional garage door. The transmission of movement to the segments is carried out by the introduction of a cylindrical dog pilot point, made in upper and lower parts of the lock, into an orifice made in an end of the segments. An elastic connection between the segments disposed on the panels located above and below the panel integrating the lock is made by a spring (R) guided by longitudinal profiles (PR1, PR2).
