Abstract (en)

[origin: FR2866136A1] The method involves obtaining a number of cellular telephones connected to a mobile telecommunication network at least once in a geographical zone during a preset time period. Main residence areas using the telephones are determined from identifiers of the telephones. Number of residents and number of tourists having used the telephones at least once in the zone during the period, is counted using the residence areas. An independent claim is also included for utilization of a method for determining number of residents in a geographical zone.
