Abstract (en)

[origin: WO2005088567A1] The invention consists in an automated gaming system comprising a central section comprising an outcome generation system, and satellite player stations. The outcome generation system generates game outcomes and signals each generated game outcome to the player stations adapted to play a game based on received outcome signals. The player stations are operated through input means disposed on an operative face of each player station and which substantially faces a side of an operative player facing toward the outcome generation system. Thus, a clear view is provided to the player to witness the outcome generated by the outcome generation system.
