Abstract (en)

[origin: FR2867004A1] The method involves temporarily retaining a part of an applicative layers data or entire applicative layers data of a data packet flow (FPD) in a data packet flow delay device (D) in a transparent manner. The flow is transmitted and received independently of delayed data and by dynamically adapting size of the delayed data. The device performs analysis and/or selective modification and/or selective filtering of the flow. An independent claim is also included for a data packet flow delay system comprising a data packet flow delay device.
