Abstract (en)

[origin: WO2005083969A2] The invention relates to a device mounted in a computer network and used to process all of the data flowing through the same. The processing involves the analysis of the data and, according to the results of the analysis, to the modification of the data, especially in terms of application. Said processing can be a complete modification of the protocol that can be applied to the data flow. Furthermore, the device can interpret a safety policy and modify the data flow according to said safety policy. The inventive device can organise all of the searches in such a way as to optimise the performances.
