Abstract (en)
[origin: EP1724417A2] The device has a lock body (2), a rotary closure element (4) opposite the lock body, a cavity rising into the lock body in which an actuating element (8) for coupling to the lock element, rotatable relative to the lock body and lying outside the lock can be reversibly attached to a cylindrical attachment section (9). The attachment section has a constantly rotating peripheral groove that can be latched with a releasable latching element movable in the lock body radially to the axis of the cylindrical attachment section and acted on by a spring towards the actuator groove : An independent claim is also included for a tool for unlocking a latching element.
