Abstract (en)

The mechanism has disengaging units including a knob and a plate (6) pivotably mounted around an axle. The knob (7) blocks the rotation of the plate to immobilize the plate such that an activation of an operating device (3) allows the activation of a pivoting control unit (5) by an intermediary of a drive component (4) when the mechanism is in an engaged position. The knob liberates the rotation of the plate such that the activation of the device causes a rotation of the plate when the mechanism is in a disengaged position.
