Abstract (en)

The mechanism has a driving cord (5) confirming with a closed loop after winding on a driving pulley driven by a low voltage DC motor (6). The cord is formed of a plastic material having a coefficient of adhesion and elasticity either to drive a door leaf (1) between open and closed positions in normal operating condition, or to slide the cord on the pulley during blocking or manual pushing of the leaf opposite to its moving direction. The cord is maintained wound on the pulley (9) and a tension pulley (8). The return of the cord is carried out on a guide pulley (10).
