Abstract (en)

[origin: EP1724804A2] A reset module (200) for an electrical safety device (100) is described having a drive lever to be manually displaced. The reset module comprises a cover that extends to cover the drive lever (112) and prevent any manual contact with the lever. The cover includes an element that engages the drive lever in order to cause, by manually moving the cover from a first to a second position, the switching of the device (100) from the closed to the opened state.
