Abstract (en)

[origin: WO2005093182A1] The invention relates to a method for construction of a supporting wall (1), in which at least one hollow building block (4) is placed between solid full blocks (3) in a first wall course (6), presenting an opening to each of the upper and the lower side thereof (7), whereby, in the subsequent wall courses (6), at least one hollow building block (4) is placed between the full blocks (3), such that the openings (7) of the hollow blocks (4) in adjacent wall courses (6) at least partly overlap each other and a material of high strength is applied into the connected cavity (8), formed by the hollow blocks (4). The invention further relates to full and hollow building blocks for carrying out said method.
