Abstract (en)

[origin: WO2005091183A1] The invention relates to a prediction method and device for evaluating and forecasting stochastic events. The problem with prediction methods and devices of this type is that they have a potentially static structure and cannot be adapted to modified data records or modified marginal conditions of the stochastic events. As the invention uses a feedback (7) of the evaluation results, a novel prediction method and a dynamic prediction device can be provided. Said method and device are in addition characterised in that they can process the input parameter records and input conditions in real time, whilst allowing a modified variable allocation to be included via an additional set-up input (15).
