Abstract (en)

[origin: EP1727169A2] The control box (14) has a printed circuit (20) arranged in a housing and supporting a set of electronic components comprising switches (28) switchable between open and closed states to activate a command. A displacement mechanism displaces the circuit in the box between an active position, in which the switch is switched, and a rest position, in which the switch is not switched.
