Abstract (en)
The mechanical model (1) of a horse comprises a body (2) with forelegs (3) and hind legs (4) adapted to be pivotally driven relative to the body (2) to cause the mechanical model (1) to move along a forward direction. Advantageously, the hind legs may be pivoted forwards until they reach a forward operating position in which they cause the mechanical model to be pivoted backwards, and to reach a second upright balanced position in which the mechanical model (1) is supported by the tail (22) and by the hind legs (2).
