Abstract (en)

The method for estimating the richness of the fuel mixture in the cylinders of an i.c. engine with a sensor (SR) located after its exhaust manifold (CE) consists of defining an estimate of the richness measured by the sensor, modelling the transfer function of the sensor, and establishing a physical model in real time of the gases ejected from the cylinders. The model is connected to an extended Kalman-type non-linear estimator, which is used to estimate a real-time value for the fuel mixture richness in each of the cylinders.
