Abstract (en)  
[origin: WO2005089613A1] The invention relates to an electric vacuum cleaner (1) comprising an electric motor, a dust-collecting chamber (8), and a working air duct (10). Said electric motor drives a fan (9) which is arranged downstream of the dust collecting chamber (8) and comprises a suction side (S) and a pressure side (D), the suction side (S) being connected to the working air duct (10) for the free blow-out of air out into the environment. The aim of the invention is to improve one such electric vacuum cleaner in terms of the blow-out behaviour, such that the air is freely blown out by means of an outer blow-out chamber (23) extending over part of the dust-collecting chamber (8).
