Abstract (en)

[origin: WO2005096972A1] The invention relates to a device for intrasurgically resetting and retaining bone fracture fragments. Said device comprises a drill wire that is introduced into the bone fracture fragments and compresses the same. According to the invention, said drill wire has a first threaded section, immediately downstream of the drill tip, and a second threaded section spaced apart from the first threaded section, combined with a fastening element which is screwed onto the first and/or the second threaded section and compresses the bone from outside.
