Abstract (en)  
[origin: WO2005088049A2] The invention relates to a fixing system comprising a fixing means (20) for fixing a window pane of a motor vehicle, a slide (102) and an element (10) for introducing regulating forces being applied to the fixing means (20). An active connection for transferring regulating forces is created in the operating position, between the fixing means (20) and the element (10) for introducing regulating forces. A reduction means (28) formed as a single component especially from the fixing means (20) and used to reduce a direct transfer of force from the slide (102) to the element (10) for introducing regulating forces fully prevents, in the operating position, a direct transfer of force from the slide (102) to the element (10) for introducing regulating forces, arranged on the fixing means (20).
