Abstract (en)

[origin: WO2005093327A1] The invention relates to a combustion chamber (1) for a gas turbine, comprising a burner system (2) and a fuel supply system (3). The burner system (2) comprises at least two burner groups (A, B), each having at least one burner (5). The fuel-supply system (3) comprises a primary line (7) that is connected to a fuel source (8), in addition to a secondary line (9) for each burner group (A, B). Each secondary line (9) is connected to each burner (5) of the associated burner group (A, B) and to the primary line (7) via a controllable distribution valve (10). A sensor system (11) detects pressure pulsation values and/or emission values for each burner group (A, B). A controller (12) controls the distribution valves (10) in accordance with the pulsation values and/or emission values, in such a way that the pulsation values and/or emission values for each burner group (A, B) are maintained at and/or fall below predetermined threshold values.
