Abstract (en)

[origin: WO2005096662A1] The invention relates to a method and communication network enabling a primary rate access digital section (DS), e.g. ISDN PRI's, to be monitored while maintaining existing OAM mechanisms in an NGN environment. According to the invention, a communication network and a method for the provision of functionality of an exchange termination unit (ET) and a line termination unit (LT) in a communication network (NW) are provided, comprising at least one time-multiplex oriented partial network (ISDN) on the subscriber side and at least one packet-oriented partial network (NGN) on the transport side, wherein a gateway (AGW) and a media gateway controller (GWC) or an SIP server are arranged at the transport-side end of the time-multiplex oriented partial network (ISDN), and the functionalities of the exchange termination unit (ET) and the line termination unit (LT) are implemented in the gateway (AGW) and/or media gateway controller (GWC) or SIP server. .
