Abstract (en)
A closing device (10) for a drawer (7) comprising an elongate hollow housing (8) which includes a front portion (8a) and a rear portion (8b), a rotating member (14) slidably mounted in the front portion and a resilient means (9) mounted in the rear portion. The front portion (8a) of the housing (8) comprises first (8c) and second portions (8d) with the first portion having a rotation-preventing internal surface (23) and the second portion having a rotation-admitting internal surface (19). A locking step (22) is defined by the differing internal cross sections of the first and second portions. The rotation of the rotating member (14) in the first portion (8c) is prevented by the internal shape (23) of the first portion relative to the external shape (13) of the rotating member. The rotating member (14) has an angular slot (11) for receiving a guiding pin (16) which is downwardly extending from the bottom surface of a top roller guide (2). When the drawer (7) is pulled out, the action of the guiding pin (16) against a first face (11') of the angular slot (11) moves the rotating member (14) axially through the first portion (8c) toward the second portion (8d). Upon reaching the locking step (22), the rotating member (14) is free to rotate within the second portion (8d) by action of the guiding pin (16) on the angular slot (11) and the rotation movement subsequently releases the guiding pin.
