Abstract (en)

[origin: EP1731649A1] Provided is a high-speed high-stand device (200) for taking up fabric (20) comprising two side boxes (210) each including a projection (211) formed on its side proximate top; a take-up shaft (220) provided across intermediate portions of the side boxes (210), the take-up shaft (220) being adapted to wind fabric (20) therearound; and a friction mechanism (230) including two arms (231) each having the other end (231a) pivotably connected to the projection (211), and a friction rod (232) fixedly interconnected one ends (231b) of the arms (231), the friction rod (232) being provided above the take-up shaft (220) to contact the fabric (20) wound therearound. In a fabric take-up process, an angle from an initial position of the arms (231) to an operating position thereof is limited as a diameter of the fabric (20) is increasing, and a pressing force exerted by the friction rod (232) on the fabric (20) being wound around the take-up shaft (220) is the same for obtaining a uniform tautness of the wound fabric (20).
