Abstract (en)  
[origin: EP1732095A2] The device has two locking units insertable in a retainer, where an inner width of the retainer is decreased by the units. Each unit blocks the removal of an end area of a switching shaft (3) from the retainer in its position in the retainer. A movable bolt (7) is provided in the switching shaft and interacts independently with the units. The bolt (7) is movable from a locking position, in which a door of an electrical switch box is locked, into a release position, in which the door is opened.
