Abstract (en)  
On a cold water circuit (10) an inner heat exchanger (2) is used to vary the thermal coupling between the high (8) and low (9) pressure sides of the inner heat exchanger. If the temperature at the exit of the compressor threatens to get too high, the exchange temperature of the inner heat exchanger is reduced, so that the cold water flowing through the evaporator (4) is not further heated by cold water coming from the high pressure side. The heat exchanger has a variable heat exchange interface by means of which the temperature of heat exchange between at least two of the media flowing through the heat exchanger can be varied. The variable heat exchanger has at least one variable material load device, and at least one adjustable fluid conduction device. The adjustable fluid conduction device is built at least in part as a flap shutter and/or as a roller blind shutter.
