Abstract (en)

A switching device (100) capable of preventing entrance of water from outside of a case through a space below an operation knob into the case is disclosed. The switching device includes: a switch (6); a case (1) within which the switch is accommodated; a hollow cylinder (7) which is formed integrally with the upper surface of the case and open to above and below to communicate with the inside of the case; an operation knob (6a) provided to cover an upper opening of the cylinder such that the operation knob can swing; and an operation bar (12) which extends through a lower opening of the cylinder into the case to transmit the motion of the operation knob to the switch. A concavity (5) is formed on the upper surface of the case at a position around the cylinder. A lid (10) for covering a part of the concavity is provided on the concavity near the cylinder.
