Abstract (en)

[origin: EP1734712A2] A method is described for correcting sampling frequency offset (SFO) of a data packet in a communications system where carrier frequency (f_c) and sampling frequency (f_s) are driven by a common clock source. The method comprises, for each l th symbol in the data packet, estimating carrier frequency offset (CFO) in a received data packet. From the CFO estimate, an SFO estimate is derived, wherein the SFO is approximately equal to f_s multiplied by said CFO estimate, and divided by f_c . An SFO phase correction is generated according to the SFO estimate for each k th tone in a data stream. The SFO phase correction is then applied to each received data stream.
