Abstract (en)
[origin: WO2005102107A1] The device comprises a U-shaped holding device (3) with three limbs, namely a base limb (a), a joining limb (b) and a supporting limb (c) of different dimensions. A wall covering is fixed by means of joining elements (5) or track elements to the front side of the supporting limb (c) in a manner that enables the wall covering to be displaced, and the base limb (a) is mounted on a supporting element (e.g. a wall) by means of connecting elements (6) or track elements of the device in a manner that enables the base limb to be displaced. The corners of the device can be provided with rotating axes whereby permitting a space-saving displacement of the covering. For heavy or large coverings, a number of devices can be coupled to one another by connecting elements. The direction of motion of the device can be freely selected (360 DEG) according to assembly and can be controlled mechanically or in an electronic-hydraulic manner by installing micro-electrical units, if desired, by remote control.
