Abstract (en)

[origin: WO2005089796A1] Provided is a method for site-specific chemical modification of an HIV gp41 -derived peptide, wherein during synthesis one or more amine groups of the HIV gp41 -derived peptide are chosen to be blocked by a chemical protecting agent, and one or more amine groups are selected to be unprotected, and remain free to be reacted with an amine reactive functionality. The resultant HIV gp41-derived peptide may be used to produce a substantially homogeneous conjugate comprised of HIV gp41-derived peptide and polymer by covalently coupling the polymer to the one or more free (unprotected) amine groups of the HIV gp41-derived peptide.
