Abstract (en)
[origin: WO2005108856A1] The invention relates to an, in particular, optical traffic signal column composed of stacked levels and fixed to one another by rotation. The base of each level has, distributed along its periphery, oblong passages (12) and fixed connectors (30). The conductors (20) are rods each having two ends (21, 23) angularly offset from one another, and the common rod (20C) is identical to the other rods (20A). The connectors are identical and they respectively fix the bottom (23) of a rod (20) of the relevant level and the top (21) of the respective rod of an adjacent level, the angular offset between the two fixing points corresponding to that of the ends of a rod. The connectors (30) and the rods (20A, 20C) are mutually arranged and mounted in order to effect, from one level to the other, an essentially identical angular positioning of the common rods and an angular offset of the other rods.
