Abstract (en)

[origin: WO2005100808A1] Disclosed is a method for the production of an axial backlash-free catching connection between at least one linear displaceable guided rod (5) and a guide unit which can be displaced in a linear manner parallel thereto in a linear drive. Adhesive (34) is applied between a coupling member (25) of the guide unit protruding in front of the rod (5) and the front surface (27) of the rod (5) and the components are then screwed into each other such that relative movements are still possible perpendicular to the direction of displacement. The entire unit is then displaced, prior to hardening of the adhesive (34), between the two end positions of the lifting thereof, wherein the components are mutually aligned. The screw connection is finally tightened when the adhesive has hardened,
