Abstract (en)
[origin: WO2005106376A1] The invention relates to an ammunition magazine (1) comprised of two ammunition channels (3, 5) with an approximately rectangular or U-shaped cross-section which, together, are wound in any shape (spiral, oval, rectangular, etc.) with one or more windings around a center inside the magazine. This enables, according to the individual case, percentually different quantities of ammunition (2, 4) to be stored inside the magazine (1) without reducing the total number of rounds.
