Abstract (en)  
[origin: WO2005104591A1] A technique for distributing content data in a first domain (145) to a plurality of network components (103) communicating in a second domain (110) is provided, wherein the network components have addresses in both the first domain and the second domain. Content data for distribution in the first domain is received together with addresses of the network components in the first domain that have been derived from the addresses of the network components in the second domain. Thereafter, the content data is distributed to the network components (103) via the first domain using the first domain addresses.
