Abstract (en)

[origin: EP1738905A2] The cylinder has a channel that extends in an axial direction and a base body (24) that comprises a retainer device. The channel is provided at a casing surface (13) that comprises an opening. A recess is formed at a front side of the cylinder, where length of the opening corresponds to length of sections of cylinder. A register unit is formed as a component that is different from the base body and is arranged separately in the channel.
