Abstract (en)
[origin: EP1739258A1] The pawl or the drive stays in positive contact with the catch or a component coupled with the catch by the mechanism in a last part of the movement of the pawl towards an excess lifting position or during further movement of the drive after reaching the lifting position of the pawl, such that the catch moves towards the release position. The lock has a pawl (3) and a catch (2) that is movable from a main closing position to a release position. A motor drive (4) is provided for moving the pawl, and a forced-opening mechanism (10) operated by the drive is provided for the catch.
