Abstract (en)
[origin: EP1740004A1] A mobile communication system in which a specific user occupies and uses a base station is provided. A base station allows a downlink signal to include not only a base station ID number indicating the base station but also an identification signal for specific use indicating that the base station is for specific use and sends the downlink signal. The terminal includes a memory (25) that stores a list of base station ID numbers of an accessible base station or an inaccessible base station every identification signal for specific use, and searches whether or not the base station ID number in the received downlink signal is in the list of base station ID number every detected identification signal for specific use in the memory when the identification signal for specific use detected from the downlink signal is ON and performs communication with the base station only when the access is OK.
